Project Rodin
There are very few applications that are useful to almost everyone. Actually, there is currently only one: the word processor.
The Brain will be a universally appealing application. It will be one of the most significant new technologies in decades. The first only thought processor. Software that does for thoughts what the word processor does for words.
The Brain approaches the computer as a computer, not a glorified typewriter, calculator, filing cabinet, or day-book. Not surprisingly, the basis of most productivity applications are concepts from the pre-computer age. By starting with mundane, non-revolutionary task metaphors, these applications are all

FIG. 22

Algorithm for drawing the plex with distant thoughts

```
1.      Create a list of thoughts to be drawn and their on screen locations:
  2.        Add the central thought to the list.
  3.        Add children to the list.
  4.        Add parents to the list.
  5.        Add jumps to the list.
  6.        Add siblings to the list, checking first that they are not
                already on the list.
  7.        Add distants of children to the list, checking first that they
                are not already on the list.
  8.        Add distants of parents to the list, checking first that they
                are not already on the list.
  9.        Add distants of jumps to the list, checking first that they
                are not already on the list.
  10.       Add distants of siblings to the list, checking first that
                they are not already on the list.
11.     Draw the lines that connect each thought:
  12.       For each item in the list:
    13.         Get each item in the list:
      14.           If the two items are related, draw lines
                        between them from and to the appropriate
                        gates.
15.     Draw the distant thoughts:
  16.       For each item in the list:
    17.         If it is a distant thought, draw it.
18.     Draw the other thoughts:
  19.       For each item in the list:
    20.         If it is not a distant thought, draw it.
```

FIG. 23

```
line connects the method for searching thoughts
lines to find a route from nSrc to nDest other than a direct relation
returns TRUE if found
boolean Search(int nSrc. int nDest)
